1- Non-Function Requirements

1.1 Usability

- **Notification System:** Our app is designed with a notification system that allows users to get informed when important events occur. For instance, an advisor will be notified when a high school applies for a tour if that tour is on the advisor's day of responsibility. Similarly, the guides will be notified when a tour is accepted and needs guides.
- **Automated Email System:** After certain events, actors will be notified by email. Such as, after the acceptance of the tour, high-school counselors will be notified. Also, new account information will be delivered to the student's Bilkent email when the coordinator creates a new account for the guide.
- **Dashboard System:** A dashboard for all actors of the Information Office to view all actions related to event planning in a user-friendly manner including the name of the closest high school visit, the number of upcoming tours and fairs.
- **Accessing the Tour Summary:** The key attributes, such as the date of the tour, number of students, and status of the tour, will be accessed by at most two button clicks.

1.2 Security/Safety

- **Account Creation:** The administrative accounts will be auto-generated by the system, and the credentials will be delivered by email. Furthermore, only the coordinator will be able to create accounts for new guides to prevent unauthorized access.
- **Limited Scope of Visible Information:** The information accessible to each user will be determined by their role in the system. For example, guides will only see essential details about system actors, such as their names, departments, and roles. More sensitive information, like email addresses and student numbers, will be restricted to the coordinator and Head to ensure privacy protection.
- **The credentials of the actors will be encrypted using an encryption algorithm and saved to the database.**

1.3 Performance

- After a guide assigns their self to a high-school tour, this change must be reflected in the system in less than 10 seconds to prevent collisions.
- All the tour interactions, such as canceling, rejecting, and accepting a tour, will be reflected in the system in less than 10 seconds.
- Page navigation within the app will not exceed 6 seconds.

1.4 Reliability

- The database structure will be organized and include backups that prevent data loss in the system.
- The system must accommodate more than 100 concurrent users to guarantee seamless access.

1.5 Maintainability

- MVC (Model-View-Controller) architecture will be implemented to separate the system's components clearly to clarify that each part can function independently. This modular structure will facilitate easier maintenance, testing, and scaling of individual system components.
- The microservice architecture will be implemented to enhance maintainability by allowing each service to be updated and maintained independently without affecting other parts of the system. This isolation will simplify debugging and testing. Moreover, it will enable us to work on different services simultaneously, increasing development efficiency, making version control process easier.

6- Mockups

A login form mockup centered on a white background, which is itself set against a dark blue and red geometric backdrop. The form features a teal soccer ball icon at the top. Below the icon is the heading "Login to your account". The form includes a dropdown menu for "Project Manager", an email input field with the placeholder "Enter email", a password input field with the placeholder "Password", and a link "I forgot password" in teal. There is an unchecked checkbox for "Remember me". A dark blue "Sign in" button is positioned below the checkbox. At the bottom, the text "Don't have account yet?" is followed by a teal "Sign up" link.
